

Lesson:

Grouping of HTML elements

HTML provides several grouping tags that are used to group elements together or define sections of content. These tags help structure the HTML document and enable developers to apply styles or manipulate the grouped elements as a unit.

Some of the most commonly used HTML grouping elements are:

- `div`
- `head`
- `body`

We can use these tags to create groups where we can apply styles, or define the section on our pages so that the code is clean and easily understandable by other developers.

Let us see examples for the above mentioned tags:

• **div:**

```
<div>
  <h1>This is heading</h1>
  <p>This is my paragraph</p>
</div>
```

• **head:**

```
<head>
  <meta charset="UTF-8" />
  <meta name="viewport" content="width=device-width, initial-scale=1.0" />
  <title>Grouping of HTML elements</title>
</head>
```

• **body:**

```
<body>
  <div>
    <h1>This is heading</h1>
    <p>This is my paragraph</p>
  </div>
</body>
```
